

How to Install EZ Energy Saver (ES)

Installation must be done by a licensed electrician. To do so otherwise will void the warranty. The ES is attached to the top of a 220/240 volt breaker/200amp service.

By installing the ES in this location, you are hitting both sides of the bus bar in your panel insuring amperage surge protection.

Installation of the Unit

1. Find the panel.

2. Take off the panel cover.

3. Drill a 7/8" hole in the corner.

4. Thread wires from the unit through the hole and start the nut on the cable protector.

5. Situate the EZ Energy Saver (ES) Unit and screw the unit into the wall.

6. Turn off the top 220/240 breaker, fasten the cable protector and strip the wire ends of the ES unit.

7. Fasten the ground lead, two hot leads to the 20-amp breaker, and connect the green wire to the grounding bar.

Connect the Hot leads and the green wire.

Loosen the screws under the breaker and slip the 2 red wires under the 2 screws and tighten.

8. Double check to make sure all wires are properly installed and connected and replace the cover.

9. Turn the breaker back on and replace the cover. The ES light should be lit.
